

Confirmation of Registration (COR)

What is the best method for your school?

COR functions: confirm registration, request tuition remittance, and report amended registration.

COR Online

Allows authorized school staff to use online screens to perform COR Functions

**For Example: If you have 500 students that have applied and need to be confirmed, the school will need to access all 500 students one by one to update the COR Status for each student to: Confirmed as Yes or Confirmed as No

PROS:

- Better for schools with fewer students
- Schools have an interface to perform COR functions , and view detailed student information
- Inquiry lookup student records

CONS:

- Can only confirm one student at a time
- **Requires more man power to handle large number of requests individually (if required)

COR Batch

Allows authorized school staff to use online screens to download/upload XML files to perform COR Functions

PROS:

- Can upload and perform COR functions on large numbers of students at a time

CONS:

- Required to convert COR Request XML files to COR Response XML files to upload large batches of students to perform COR functions
- Need to be familiar with the COR Request and COR Response XML file formats. Recommended the school creates an automated process to create these XML files

Batch Procedure via Automated COR Web Service

Allows certified schools to exchange batch XML files with Alberta Student Aid to automatically upload COR information via a web service

PROS:

- Confirm students on demand one by one or large amounts of students at a time automatically from school software to the automated COR Web Service

CONS:

- Requires system changes to communicate and integrate with the COR Web Service which require school technical staff to work with SFS technical staff to develop and test
- School will need to get certified to use this process
